**Canadian Technical Report of
Fisheries and Aquatic Sciences 2881**

Canadian Technical Report of Fisheries and Aquatic Sciences

Technical reports contain scientific and technical information that contributes to existing knowledge but which is not normally appropriate for primary literature. Technical reports are directed primarily toward a worldwide audience and have an international distribution. No restriction is placed on subject matter and the series reflects the broad interests and policies of Fisheries and Oceans Canada, namely, fisheries and aquatic sciences.

Technical reports may be cited as full publications. The correct citation appears above the abstract of each report. Each report is abstracted in the data base *Aquatic Sciences and Fisheries Abstracts*.

Technical reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page.

Numbers 1-456 in this series were issued as Technical Reports of the Fisheries Research Board of Canada. Numbers 457-714 were issued as Department of the Environment, Fisheries and Marine Service, Research and Development Directorate Technical Reports. Numbers 715-924 were issued as Department of Fisheries and Environment, Fisheries and Marine Service Technical Reports. The current series name was changed with report number 925.

Rapport technique canadien des sciences halieutiques et aquatiques

Les rapports techniques contiennent des renseignements scientifiques et techniques qui constituent une contribution aux connaissances actuelles, mais qui ne sont pas normalement appropriés pour la publication dans un journal scientifique. Les rapports techniques sont destinés essentiellement à un public international et ils sont distribués à cet échelon. Il n'y a aucune restriction quant au sujet; de fait, la série reflète la vaste gamme des intérêts et des politiques de Pêches et Océans Canada, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports techniques peuvent être cités comme des publications à part entière. Le titre exact figure au-dessus du résumé de chaque rapport. Les rapports techniques sont résumés dans la base de données *Résumés des sciences aquatiques et halieutiques*.

Les rapports techniques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre.

Les numéros 1 à 456 de cette série ont été publiés à titre de Rapports techniques de l'Office des recherches sur les pêcheries du Canada. Les numéros 457 à 714 sont parus à titre de Rapports techniques de la Direction générale de la recherche et du développement, Service des pêches et de la mer, ministère de l'Environnement. Les numéros 715 à 924 ont été publiés à titre de Rapports techniques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 925.

Mather, L., MacIntosh, K., Kaczmarska, I., Klein, G. and Martin, J.L. 2010. A checklist of diatom species reported (and presumed native) from Canadian coastal waters. Can. Tech. Rep. Fish. Aquat. Sci. 2881: iii + 78p.

ABSTRACT

Mather, L., MacIntosh, K., Kaczmarska, I., Klein, G. and Martin, J.L. 2010. A checklist of diatom species reported (and presumed native) from Canadian coastal waters. *Can. Man. Rep. Fish. Aquat. Sci.* 2881: iii+ 78 p.

The transportation of phytoplankton via ballast water is one of the main vectors allowing organisms to establish themselves in new environments. Since the 1970s, both the frequency of ocean crossings and the volume transported has increased. Therefore, it is to be expected that the potential for invasion would have also increased.

Although reviews on the species richness of native biota have been done for some areas of the world, a clear and concise list of the presumed native biota for Canadian waters has yet to be documented.

The aim of this report is to provide a list of diatom species found as their names appear in the cited literature, as well as their current valid name, from the Canadian and the neighbouring north, east, and west coasts of North America. This will allow for a better understanding of the presumed native diatoms, and thus the potentially non-native diatom species, documented in Canadian waters. As well, it provides a time-line for when these organisms were documented as occurring in our waters.

RÉSUMÉ

Mather, L., MacIntosh, K., Kaczmarska, I., Klein, G. and Martin, J.L. 2010. A checklist of diatom species reported (and presumed native) from Canadian coastal waters. *Can. Tech. Rep. Fish. Aquat. Sci.* 2881: iii+ 78 p.

Le transport des eaux de ballast est un des vecteurs principal dans le transfert du phytoplancton qui permet à ces organismes de s'établir dans un nouvel environnement. Depuis les années 1970 la capacité et la fréquence des navires long courrier ont augmenté, ainsi que le potentiel d'invasion.

Ailleurs au monde, des recensements de la richesse des espèces natives ont été achevés mais jusqu'à date il n'y a aucune liste documentée pour les diatomées présumées indigènes dans les eaux canadiennes.

Le but de ce rapport est de dresser une liste des diatomées trouvées dans les eaux canadiennes et des côtes adjacentes du nord, est et ouest de l'Amérique du Nord. Cette liste comprend le nom de l'espèce comme il apparaît dans la littérature citée ainsi que le nom courant valide. Elle offre une meilleure compréhension des diatomées dites natives et subséquemment des espèces non indigènes dans les eaux canadiennes. Également, cette liste permet de dresser une ligne temporelle depuis quand ces organismes ont été observés dans nos eaux canadiennes.

INTRODUCTION

The confirmed introduction of non-indigenous and toxic or harmful phytoplankton species via ballast water in Australia (Hallegraeff et al. 1988) and other waters around the world has established a growing concern regarding our ability to recognize newcomers for the North American coasts (Edlund et al. 2000, Mills et al. 1993, Ricciardi 2001). The possibility for invasion of a species is not only determined by whether or not a transfer vector is available to the organism, but whether or not the environmental conditions, such as nutrient availability and temperature, of the new location facilitate survival. These introduced organisms pose obvious ecological risks to native habitats but the risk is further magnified by the potential that such organisms may become toxigenic or otherwise harmful once introduced. However, before identifying a species as alien, a good understanding of species richness in native biota is needed. Examples of documentation of native species include: diatoms of the United States (Patrick and Reimer 1966, 1975), diatoms of Europe (Hustedt 1930, 1939, Krammer 2000, 2002, Lange-Bertalot 2001) and diatoms of British coast (Hendey 1964). Such systematic work from the microbial community is yet to be undertaken for marine diatoms in Canadian waters.

This work was initiated through a project funded by the Canadian Aquatic Invasive Species Network (CAISN) to study the potential for diatoms to invade Canadian marine and freshwater environments through the transport of ballast water. CAISN is an organization that is conducting a comprehensive study examining and identifying existing invasions with the goal of preventing future invasions from foreign locations into Canadian ports. The overall mission of CAISN is to reveal to the public the results of an expansive network of research and to raise awareness and initiate policy changes when it comes to aquatic invasive species. As part of this project, ballast water samples from ships coming to the ports of Halifax and Montreal (East Coast), Vancouver (West Coast), and the Great Lakes were examined for the potential of diatoms species to survive and thrive in these tanks. As this research was conducted, a list of species' names and references was collected to aid in mapping the potential for change in species' composition in our waters.

This report documents diatoms (*Bacillariophyta*) that have been observed in Canada and the neighbouring north, east and west coasts of North America, and thus would be expected to naturally occur in Canadian waters.

Reported species are documented, including: 1) the diatom species name listed as it appears in its original publication; 2) the species current and valid name; and, 3) the common synonyms, verified through the two taxonomic databases: algae base and catalogue of life (algaebase.org, catalogueoflife.com). Use of invalid names or synonyms can cause erroneous or confusing reports of species of micro-biota. Diatom species reported here were collected from a total of thirty published sources that represent the years spanning 1910-2008 (see Appendix 1), and five lists obtained through personal communications (B. Ginn, Dept. of Biology, Queen's University, 116 Barrie St., Kingston, ON Canada K7L 3N6; L.A. Hobson, University of Victoria, PO Box 1700 STN CSC, Victoria, BC Canada V8W 2Y2; R.A. Horner, University of Washington, Box 357940, Seattle, WA 98195-7940; J.L. Martin, Biological Station, 531 Brandy Cove Road, St. Andrews, NB Canada E5B 2L9; and C. Rafuse, National Research Council Institute for Marine Biosciences, 1411 Oxford Street, Halifax, NS Canada, B3H 3Z1). Ballast waters from transoceanic vessels can be a major means by which diatoms are transported to ports throughout

the world. The volume and frequency of these ocean crossing vessels has significantly increased since the 1970s, with increasing introductions at the close of the 20th century (Carlton 1996), a time span sufficient for microorganisms such as diatoms to establish themselves in Canadian waters. Examples from the macroscopic level include species such as the zebra mussel (*Dreissena polymorpha*) and the Emerald ash boring beetle (*Agrilus planipennis*) - non-indigenous invaders that are now well established in Canada. There is growing evidence that the potential for invasions to occur at a microscopic level exists as well - as has been documented for the species *Didymosphenia geminata* (Lyngbye) M. Schmidt (Blanco and Ector 2009) and *Thalassiosira baltica*, (Edlund et. al. 2000) - all of which necessitates more research focusing on microbes, both native and those arriving from exotic locations.

In this list, some diatoms presumed by many to be non-indigenous diatoms, have been found to be reported in some locations in Canada as early as 1910. One such example is *Achnanthes subsessilis* K., (Bailey 1910). Another example is *Pseudo-nitzschia fraudulenta* (Cleve) Hasle, a species thought to be cosmopolitan, but was first observed in the Bay of Fundy as recently as the year 2008 (Martin and LeGresley 2008). Some species such as *Tabellaria flocculosa* (Roth) Kützing, (Hay et. al. 2003; Bailey 1913) are most likely native to our waters as they have been reported both before and after 1970, when the volume and frequency of ocean crossing vessels began to increase substantially (Carlton 1996). As more organisms become established, it is increasingly difficult to determine whether or not species are indigenous or introduced. Thus, uncovering the time-lines to which these species occur can indicate the possibility for establishment of new species in our coastal waters as well as the potential for species (native/non-native) to sustain themselves within the environment. More species, established through ballast water transport, are indicated in a manuscript written by Klein et al. (2009).

We appreciate that some taxa included in this report might have been introduced centuries ago given that seafaring communities have existed on the Canadian East coast since the 1600s. Until presented with evidence to the contrary, we assume these species to be indigenous.

The goal of this compilation is to provide baseline data of our current understanding of marine diatom species composition in Canada. This will aid in recognizing non-native arrivals found through various vectors including incoming ships' ballast water and sediments.

MATERIALS AND METHODS

Books and papers collected from scientific journals were checked for species' lists. As well, various colleagues were contacted and contributed their personal species' lists. Details on the collection of samples are described in the books and papers cited in this manuscript and the names of the colleagues who contributed their lists are listed in the Acknowledgements.

RESULTS

Approximately 893 valid names are listed, representing 160 diatom genera that include 825 species and 69 subspecies level taxa. Of these, some are marine and brackish, likely collected in

situ, but others are known to be from freshwater and most likely introduced into the marine environment from inland sources. Appendix I presents the species' names as they are found originally as well as current accepted names and synonyms. Each species' name has been cited indicating the source of the information and the known geographic location in Canada (East, West or Arctic) of the species is documented.

DISCUSSION

This checklist of species represents the start of documenting species currently observed in North American marine waters, specifically those found on the Canadian marine coasts. The intent of this publication is to make the present data available for examining the composition of diatom species in Canadian waters, both present and from the past. This will provide valuable baseline data on native diatom species and give a greater understanding of the potential for introduction of new organisms from foreign locations that may exist in our coastal regions and establish themselves.

This list may also aid in identifying species that are cryptogenic, that is species that have not been confidently identified as being native or introduced (Carlton 1996). Cryptogenic species are ones that have an unknown origin, or an origin that is not explicitly clear. It seems inevitable that marine organisms that are moved transoceanically into habitats wherever vectors implicated in their transport have gone would be classified as being cryptogenic (Carlton 1996). The understanding that cryptogenic species may be more common than originally thought makes it possible for one to significantly underestimate the impacts of biological invasions on natural and previously invaded communities (Carlton 1996). Neglecting this information may lead to a misleading interpretation of invasion corridors, the types of communities susceptible or resistant to invasions, and invasion success rates (Carlton 1996).

Although we have included the vast majority of papers and books that list species from the North American marine coast, specifically from Canadian waters, we acknowledge that this may not be representative of all the data available and as more research is being conducted more species may be detected.

ACKNOWLEDGEMENTS

Partial funding for this work was through Canadian Aquatic Invasive Network (CAISN) to I. Kaczmarska. The CAISN organization is partners with a number of organizations including Natural Sciences and Engineering Research Council of Canada (NSERC), the Department of Fisheries and Oceans, Transport Canada, the Ontario Ministry of the Environment, and Ontario Ministry of Natural Resources. We gratefully acknowledge the following colleagues who kindly shared their species lists, in alphabetic order of surname: Brian Ginn (PhD research at Queen's University pending his acceptance), Louis Hobson (University of Victoria), Rita Horner (University of Washington), and Cheryl Rafuse (Dalhousie University). We thank Rita Horner and Murielle LeGresley for reviewing; Charlotte McAdam for editing and Joanne Power for formatting the manuscript.

APPENDIX I

Table I : List of species documented from east, west and arctic North American coastal waters, with emphasis on Canadian waters. (BoF= Bay of Fundy, US= United States, pers. comm.= personal communication, (col)= catalogue of life, (ab)= algae base). References outside parentheses are the original papers for reference of species' name while references within parentheses are from additional papers that support the presence of a species.

¹Ginn (pers. comm.) - B. Ginn, Queen's University, Dept. of Biology, 116 Barrie St., Kingston, ON Canada K7L 3N6

²Martin (pers. comm.) -J.L. Martin, Biological Station, 531 Brandy Cove Road, St. Andrews, NB Canada E5B 2L9

³Horner (pers. comm.) - R. Horner, University of Washington, School of Oceanography, Box 357940, Seattle, WA 98195-7940

⁴Rafuse (pers. comm.) - C. Rafuse, National Research Council - Institute for Marine Biosciences, 1411 Oxford Street, Halifax, NS Canada B3H 3Z1

⁵Hobson (pers. comm.)- L.A. Hobson, University of Victoria, PO Box 1700 STN CSC, Victoria, BC Canada V8W 2Y2
