

# TUBERCULOSIS IN CANADA, 2020

Tuberculosis (TB) is a disease that primarily affects the lungs, but can also affect other areas of the body. Despite TB being both preventable and curable, Canadians still experience active TB, although the overall rate has not changed appreciably over the last decade.

Nearly 10% of active TB cases were resistant to TB drugs

## Canada aims to achieve TB elimination through:

Sustained engagement with communities by all levels of government.

Improvement in monitoring, prevention, and TB treatment.

Addressing the social determinants of health related to TB.

Increased coordination of TB surveillance and programmatic areas.
