The following figures, tables and explanatory text were prepared by:

**Howard Njoo, MD, MHSc, FRCPC  
Director  
Tuberculosis Prevention and Control**

**Penny Nault  
Tuberculosis Database Manager  
Tuberculosis Prevention and Control**

**Melissa Phypers, MSc  
Senior Epidemiologist  
Tuberculosis Prevention and Control**

## **ACKNOWLEDGEMENT**

---

The authors would like to acknowledge the Provincial/Territorial Tuberculosis Programs and their teams for their contribution to and participation in the Canadian Tuberculosis Reporting System (CTBRS).

The authors would also like to thank the Scientific Publication and Multimedia Services Unit, Population and Public Health Branch, for its assistance in preparing this report.

# INTRODUCTION

---

The 1998 *Tuberculosis in Canada* annual report is a publication of Tuberculosis Prevention and Control (TBPC), Centre for Infectious Disease Prevention and Control, Population and Public Health Branch, Health Canada. Reports of new active and relapsed tuberculosis cases are reported to TBPC through the Canadian Tuberculosis Reporting System (CTBRS) from the ten provinces and two territories.

This publication is similar to previous annual reports published by TBPC and presents summary data for cases reported to the CTBRS which were diagnosed in 1998. The report contains information on the overall TB case counts and case rates for selected demographic and clinical characteristics. Presented in the report are data on the following characteristics:

- age
- gender
- province/territory
- birthplace
- activity status
- main diagnostic site
- bacillary status
- pattern of drug resistance
- method of detection
- immigration status
- HIV status.

The increased proportion of tuberculosis in foreign-born individuals is reflected in the tables wherein the birthplace (grouped by World Health Organization (WHO) region) is presented as a variable (Tables 3, 6, 8, 10, 11, 13, 16, 18, 19, 20).

As a result of a review of the national tuberculosis surveillance system conducted jointly in 1997 by the Canadian Tuberculosis Committee and TBPC, two previously included tables have been excluded from the report. No longer included are:

1. Reported new active and relapsed tuberculosis cases by bacillary status and main diagnostic site – Canada and provinces/territories; and,
2. Reported new active and relapsed tuberculosis cases by birthplace and bacillary status – Canada and provinces/territories.

Two new tables have been added that present data items on the pattern of drug resistance (at time of reporting) to first line anti-tuberculosis drugs for TB cases diagnosed in 1998 (Tables 15 and 16). Furthermore, changes in the order of presentation of Tables 12, 13 and 14 have been made. Reported new active and relapsed tuberculosis cases by bacillary status and other selected characteristics are now reported with the culture status first, followed by the microscopy status.

Appendices to the report include population estimates for 1998 (Appendices 1A, 1B), the tuberculosis reporting form (Appendix 2) and technical notes on the methodology of the report including the definition of terms (Appendix 3).

The annual reports on tuberculosis morbidity have undergone and will continue to have revisions in format and content from year to year. It is our goal to continue to adapt and improve this publication in response to changes in the epidemiology and treatment of tuberculosis. We welcome any comments on the content or format of this document.

## **EXECUTIVE SUMMARY**

---

In 1998, a total of 1,796 cases (5.9 per 100,000) of new active and relapsed tuberculosis (TB) were reported to Tuberculosis Prevention and Control from the ten provinces and two territories. This number represents a decrease of 9% from 1997 (6.6 per 100,000) and is the lowest number of reported cases in the last two decades. New active cases made up the vast majority (90%) of reported cases with relapsed cases accounting for the remainder.

Six of the reporting jurisdictions had case rates below the national rate (Alberta, New Brunswick, Newfoundland, Nova Scotia, Prince Edward Island and Quebec). The three most populous provinces (Ontario, Quebec and British Columbia) which collectively make up 75% of Canada's population, also accounted for 75% of the total number of reported cases. Compared with the previous year, seven reporting jurisdictions (Alberta, British Columbia, Newfoundland, Ontario, Prince Edward Island, Quebec and Saskatchewan) reported a decrease in case numbers and rates. Slightly increased rates were reported for Manitoba, New Brunswick, the Northwest Territories and Nova Scotia. There was no change for the Yukon Territory (Table 1A).

Trends with respect to TB incidence and birthplace continue to indicate the highest burden of disease among the foreign-born population. From 1988 to 1998, the number of cases among Canadian-born non-Aboriginal individuals decreased by 52% (724 to 348 cases), while that among Canadian-born Aboriginal people decreased by 16% (332 to 278 cases). During the same time period, the number of cases among foreign-born persons increased by 33% (891 to 1,154 cases). Of note, however, is that the most dramatic decrease in TB cases reported for 1998 occurred in the foreign-born population with the total number of cases falling from 1,271 in 1997 to 1,154 in 1998 (Table 3). The proportions of all TB cases that were Canadian-born non-Aboriginal, Canadian-born Aboriginal and foreign-born in 1988 were, 37%, 17% and 46% respectively. By 1998, these proportions had decreased among Canadian-born non-Aboriginal and Canadian-born Aboriginal people to 19% and 15% respectively, whereas among the foreign-born the proportion had increased to 64%.

With regard to the distribution of cases by birthplace across the country in 1998, the provinces of British Columbia and Ontario reported the highest percentage of foreign-born cases (71% and 83% respectively). In other jurisdictions foreign-born cases accounted for over half of all reported cases (Alberta 59%; Quebec 56%). In the Northwest Territories, Saskatchewan and Manitoba, cases among Canadian-born Aboriginal people contributed all or a large percentage of reported cases (Northwest Territories 100%; Saskatchewan 85%; Manitoba 43%) (Table 3).

By age group, individuals aged 25 to 34 years made up the largest number of reported cases, accounting for 17% of the total. However, the corresponding case rate of 6.7 per 100,000 for this age group was surpassed by the age-specific rates of 11.1 and 16.1 per 100,000 for those in the older age groups of 65 to 74 and greater than 74 years respectively (Table 2A). Canadian-born non-Aboriginal cases were relatively older (median 58 years) than foreign-born (median 41 years) and Canadian-born Aboriginal TB cases (median 30 years).

The presentation of tuberculosis by gender revealed a larger number of reported cases among males (968 cases, 6.4 per 100,000) than among females (828 cases, 5.4 per 100,000) (Tables 2B, 2C).

Overall, respiratory TB (see Technical Notes for definition) was the main diagnostic site, representing 64% of reported cases in 1998 (Table 4). A larger proportion of Canadian-born non-Aboriginal cases were reported as respiratory TB (75%) compared with that among both the Canadian-born Aboriginal and foreign-born cases (56% and 63% respectively). TB of the peripheral lymph nodes was the second most commonly reported diagnostic site, with almost half of all such cases occurring in foreign-born individuals who originated in the WHO Western Pacific Region. Among the Canadian-born Aboriginal cases, primary TB accounted for the most significant proportion (26%) of all notifications after respiratory TB (Table 10).

A total of 1,597 of the 1,796 reported cases (89%) were laboratory confirmed. Of the 1,152 respiratory cases, 54% were smear (microscopy) positive and 85% were culture positive (Table 14).

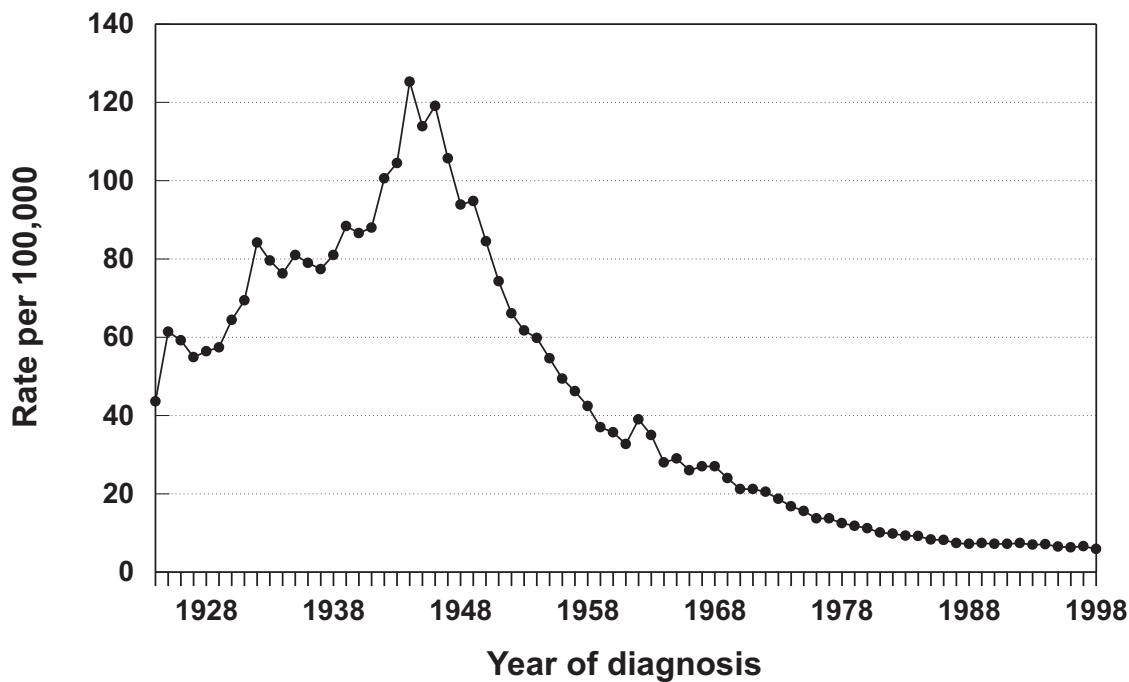

The majority of reported cases (74%) were detected through presentation of symptoms to a medical professional (Table 17).

Of the 1,796 cases diagnosed in 1998, 122 were reported to have died in the same year. TB was reported as the underlying cause of death for 19 cases (16%). For 54 cases (44%), TB was reported as contributing to death, but not as the underlying cause (Table 23). It should be noted that the number of reported TB related deaths is an underestimate, as it includes only known deaths occurring in the same year as the diagnosis at the time of reporting.

In recognition of the important interaction between TB and HIV infection, collection of HIV status began in 1997. The analysis of this variable indicated that HIV status was unknown for 92% of reported cases (Table 25). Further collaborative efforts with each of the provincial and territorial TB control and HIV/AIDS programs is necessary to gain a better understanding of the extent of TB/HIV co-infection in Canada.

\* Not all provinces routinely test for resistance to all first-line anti-tuberculosis drugs (see Technical Notes).

\*\* MDR-TB is defined as resistance to at least INH and RMP.

## APPENDIX 3

### TECHNICAL NOTES

---

#### **METHODOLOGY AND DATA QUALITY REPORT**

##### **Data collection**

The Canadian Tuberculosis Reporting System (CTBRS) maintained by Tuberculosis Prevention and Control (TBPC), Centre for Infectious Disease Prevention and Control, Population and Public Health Branch, Health Canada, is derived from records of provincial/territorial tuberculosis registries. The reporting system is designed to capture information on every new active or relapsed case of tuberculosis occurring in Canadian residents and visitors. All provinces and territories have legislation requiring physicians, laboratories and other health officials to report cases of tuberculosis to an office of tuberculosis control. In most provinces and territories, information on cases is collected using a standard notification form (see Appendix 2), and reported to Tuberculosis Prevention and Control annually.

Information is included on age, gender, residence, aboriginal status, country of birth, diagnosis, and bacteriological status. The Canadian Tuberculosis Committee is responsible for determining the content of the database. Recent revisions have resulted in the inclusion of more detail with respect to high risk populations, methods of detecting cases, antibiotic resistance, treatment date, drugs prescribed, previous TB history, Immigration status, HIV status and, for deceased persons, information on cause and date of death.

Case reports are completed in the provincial/territorial registries, where codes are entered for diagnosis (using the ICD-9), residence, birthplace and other items. Some provinces have computerized their data, and four provinces currently send data in electronic form.

##### **Data processing**

Case notifications received at Tuberculosis Prevention and Control are logged, checked for completeness and reasonableness, and filed. Data are captured in a standard format on computer, with validity and correlation edits being an integral part of the data entry program. Lists of cases together with any queries arising from edit failures are returned to provincial/territorial directors for review, correction of errors and ascertainment of completeness of case lists for the year.

##### **Calculation of rates**

The rates used in this report have been calculated using population figures provided by the Demography Division of Statistics Canada and Indian and Northern Affairs Canada (see Appendices IA and 1B). The population estimates have been adjusted for net census undercoverage and include non-permanent residents. For more information, see 'Population Figures' in the Definitions of Terms section and reference 1. Because of adjustment of the population estimates and updates to the reported number of cases in some provinces, case counts and rates appearing in this report may differ slightly from those in previous reports emanating from TBPC.

## Data quality

Several aspects of data quality affect the usefulness of the data: completeness of reporting (or coverage), completeness of item response, accuracy or validity of responses and timeliness.

Coverage of the tuberculosis reporting system has not been explicitly reviewed at the national level. Regional differences in the availability of diagnostic facilities and resources as well as the degree of active versus passive surveillance may affect the overall coverage of the reporting system. Furthermore, tabulations in annual reports may be slightly incomplete because case notifications received after a cut-off date are not included.

Of the cases reported to Tuberculosis Prevention and Control, reporting of most core data items is virtually complete. Reporting is less complete for some of the data items more recently introduced (i.e. HIV status).

Some limitations should be kept in mind when using and interpreting the data. For the variable referring to "origin", the definitions of "Registered Indian", "Unregistered Indian or Métis", "Inuit" and "Other" as reported on the case notification forms may not strictly correspond to the definitions used by Census Canada or by Indian and Northern Affairs Canada in estimating corresponding populations. The terms "new active" and "relapsed" may be interpreted differently in different provinces/territories; the definitions of these terms were revised effective January 1, 1997 (see [Definitions of Terms](#)). Also, with the introduction of Tables 15 and 16, the reader should be cautioned against making comparisons with data presented in *Tuberculosis: Drug resistance in Canada 1998*<sup>(2)</sup> as reporting methods differ. First line anti-tuberculosis drugs include Isoniazid (INH), Rifampin (RMP), Ethambutol (EMB), Streptomycin (SM) and Pyrazinamide (PZA). Routine testing is not performed for SM for Nova Scotia, New Brunswick and Prince Edward Island. Routine testing for PZA is not performed for British Columbia, Saskatchewan and the Yukon Territory.

Data in this report are tabulated according to year of diagnosis however, since 1990, Ontario data have been tabulated according to episode date (which is the closest approximation of date of onset of illness), and since 1997, Quebec dates have been tabulated according to report date.

## Other sources of information

In addition to these annual data on new active and relapsed cases of tuberculosis in Canada, the numbers of tuberculosis cases are presented monthly, based on date of diagnosis, by province, age group and gender as part of the 'Notifiable Disease Summary' appearing in the *Canada Communicable Disease Report*<sup>(3-5)</sup>.

While the latter series provides useful current information, the consolidated annual data on new and relapsed cases appearing in this report must be considered the more authoritative source of information on tuberculosis reporting for Canada.

## **DEFINITION OF TERMS**

### **Tuberculosis registry**

The central organization within a province/territory that receives, records and accumulates information on and follows up all reported cases of tuberculosis, and maintains a register of persons with tuberculosis.

### **Notification**

The receipt of a report concerning a new active or relapsed case of tuberculosis meeting the tuberculosis case definition.

### **Tuberculosis case definition**

Effective January 1, 1997:

#### **I TB case definition in the Canadian tuberculosis reporting system**

- a. Cases with *Mycobacterium tuberculosis* complex (i.e. *M. tuberculosis*, *M. bovis* [excluding BCG strain] or *M. africanum*) demonstrated on culture

OR

- b. In the absence of bacteriological proof, cases clinically compatible with active tuberculosis that have, for example:
  - i chest x-ray changes compatible with active tuberculosis including idiopathic pleurisy with effusion
  - ii active extrapulmonary tuberculosis (meningeal, bone, kidney, peripheral lymph nodes etc.)
  - iii pathologic or post-mortem evidence of active tuberculosis

**Note:** Molecular biological techniques are research tools and are not included in the definition.

#### **II Cases of tuberculosis diagnosed in Canada include all cases: Canadian born, immigrants, refugees, refugee claimants, students, visitors, migrant workers and illegal aliens.**

Visitors = those non-Canadians travelling with or without a visa, stopping in Canada en route

#### **III New and relapsed (reactivated) cases of tuberculosis**

**New case:** no documented evidence or history of previously active tuberculosis.

**Relapsed (reactivated) case:** documented evidence or history of previously active tuberculosis which became inactive.

**Inactive tuberculosis:**

- a. Cultures for *Mycobacterium tuberculosis* negative for at least six months

OR

- b. In the absence of cultures, chest (or other) x-rays, stable for a minimum of six months.

## **Diagnostic classification**

The classification used is the *International Classification of Diseases, 9th Edition*. Up to five diagnoses per case are captured and presented as Main Diagnostic Site using the following hierarchy: primary, miliary/disseminated, respiratory (includes pulmonary, pleurisy and other respiratory), meninges and CNS, peripheral lymph node and other sites. Based on this classification, a case can have more than one diagnosis.

## **Deaths**

This report contains statistics on deaths from the Canadian tuberculosis reporting system, which introduced new questions in 1990 concerning deaths of persons registered as cases of active tuberculosis. These statistics are shown in Tables 23 and 24 and are based on the patient's status at time of reporting (for Ontario they are based on "episode date").

## **Population figures**

In 1993, Statistics Canada introduced a new series of population estimates that include non-permanent residents and adjustments for net census undercoverage. The series for provinces and territories comprises annual population estimates beginning with 1971.

In this report the 1998 overall population estimates for Canada and provinces/territories by gender and age group are based on adjusted 1996 census data.

Population estimates of Canadian-born Aboriginal people are based on Projections of Population with Aboriginal Ancestry, Canada, Provinces/Regions and Territories, 1991-2016 (Statistics Canada), and Population Projections of Registered Indians, 1991-2015 (Indian and Northern Affairs Canada).

Population estimates of foreign-born people by birthplace are based on 1996 Census data (Statistics Canada).

The 1996 population estimates of total Canadian-born people are calculated by subtracting the foreign-born census (1996) figures from 1996 population estimates (Statistics Canada).

The 1996 population estimates of Canadian-born non-Aboriginal people are calculated by subtracting the total Aboriginal estimates from total Canadian-born estimates.

### **Population**

Persons whose usual place of residence is somewhere in Canada or who are non-permanent residents. In census years this is the enumerated population adjusted for net census undercoverage, while population estimates are used for intercensal years.

### **Non-permanent residents**

The following five groups of persons residing in Canada, referred to globally as "non-permanent residents", were added to the census population universe in 1991: persons claiming refugee status, persons holding a student authorization, persons holding an employment authorization, persons holding a minister's permit and all non-Canadian-born dependants of the aforementioned individuals.

### **Net census undercoverage**

The difference between census undercoverage and census overcoverage. The former refers to persons not enumerated in the census but who were part of the census universe, while the latter refers to persons either enumerated more than once or enumerated but not part of the census universe. Undercoverage exceeds overcoverage with few exceptions at all levels of demographic and geographic disaggregation.

## **More information**

More information on definitions used and coding instructions is available upon request from Tuberculosis Prevention and Control, Population and Public Health Branch at Health Canada. Medical terminology regarding bacteriological aspects, diagnosis, dissemination, treatment, prevention, screening and control of tuberculosis is well documented in *Canadian Tuberculosis Standards, Fifth Edition*, 2000, available from the Canadian Lung Association<sup>(6)</sup>.
