APPENDIX 7.1 List of Mortality Classifications

Mortality Rate and Mortality Categories Recorded and Reported by BC Salmon Farmers Association Fish Health Database

Average Mortality Rate

The average mortality rate is calculated as the total number of carcasses out of the total number of fish cultured in that zone or sub-zone. This is reported for each species in the zone or sub-zone for each category of water type on a quarterly basis. For example, “all zones Pacific freshwater” data indicate the average mortality rate for all Pacific salmon of all zones cultured in fresh water.

Mortality Rate by Cause (previously: Proportional Mortality by Cause)

The mortality rate by cause is intended to provide a detailed breakdown of the average mortality rate. This breakdown indicates what proportion of the average mortality is attributed to each of the causes below. Since the reasons for death vary in fresh and saltwater rearing environment and by species, the reports provided to BCMAL reflect these different causes.

Mortality Causes – Fresh water:

Data entry starts at the EYED EGG stage and is reported in monthly intervals to the BCSFA Industry Database.

- Culls/quality control: includes all culls for inventory management (e.g., precocious males and non-smolts.)
- Systems related: rolled up category that includes all losses due to acute incidents, including:
 - systems/physical plant problems (e.g. power outage);
 - transport incidents, accidents;
 - any acute disruption of “life support” for the fish; and,
 - vandalism and acute human induced toxicological events.
- Background mortality: rolled up category that includes all causes that are not culls, systems-related or fresh carcasses, including:
 - Poor performers (smalls, deformities, non-smolts (died, not culled), pin heads etc.);
 - Water chemistry problems;
 - Eye pick;
 - Jumpers;
 - Feed/ feeding problems;
 - Handling;
 - Old (not of histological (diagnostic) quality);
 - Fungus;
 - Parasites;
 - Bacterial Gill Disease (BGD); and,
 - Predators.

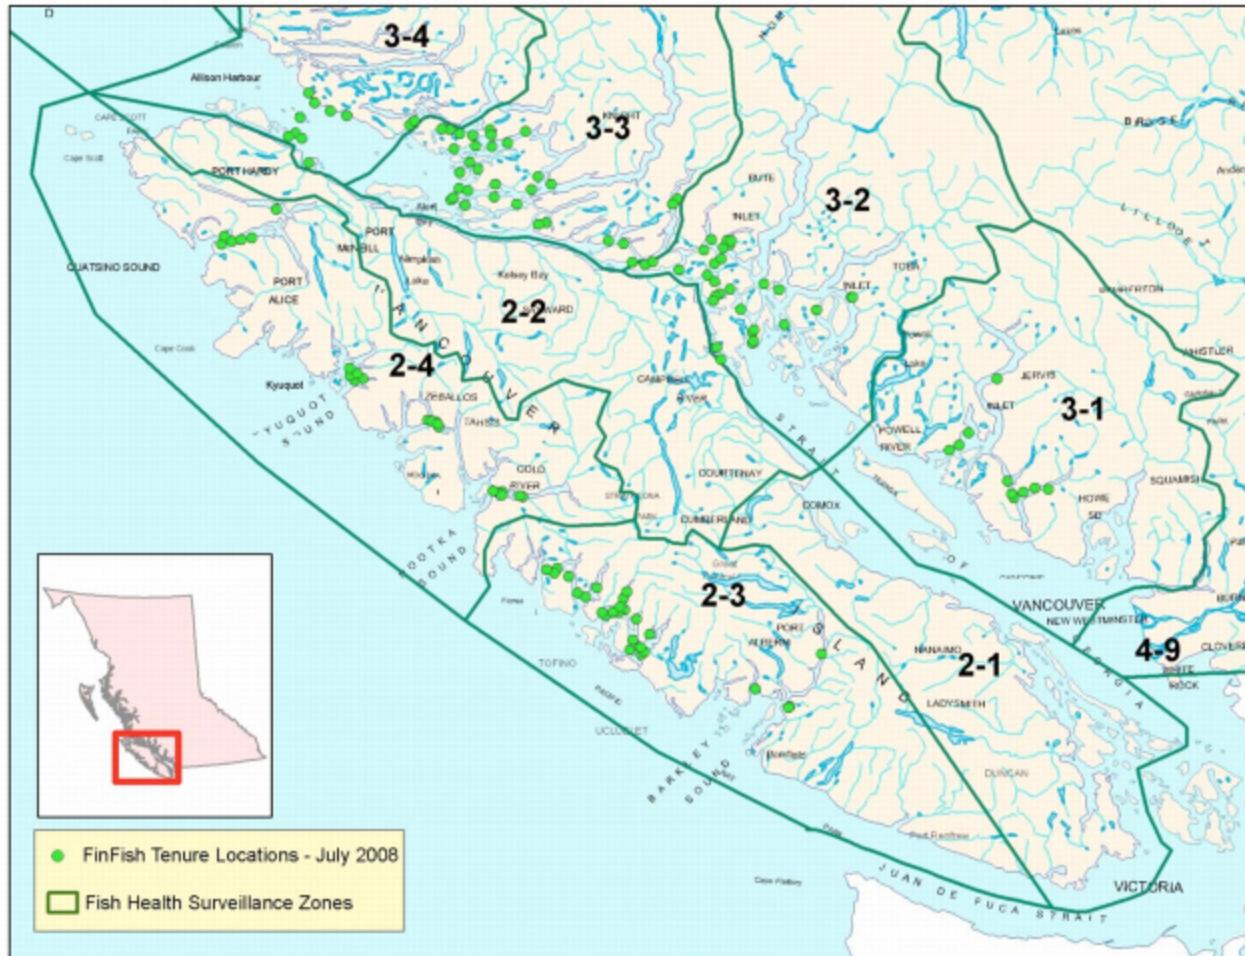

- Fisheries and Oceans Canada (DFO) divides the background mortality category into:
 - Husbandry-related including feed/feeding problems, handling, treatment errors; and,
 - Routine / daily: mortalities—fungus, predators etc.
- Fresh: rolled up category that includes total number of “fresh” carcasses
 - Mortalities due to suspected disease;
 - Unexplained mortality; and,
 - Mortalities —of concern”.
- DFO puts all fresh carcasses, resulting from unexpectedly high mortality rates, and all suspect mortalities (including BGD, parasites, and other disease) into the “fresh” category.

Mortality Causes – Salt water:

This applies to all sea water fish farms, acclimation pens, captive brood stock (DFO) and preliminary rearing of select stocks prior to saltwater release (by DFO). These categories are intended for smolt and post-smolt life stages, including “smolt”, “immature/grow-out/harvest” and “brood stock”.

- Predators: total number of carcasses due to predators
- Environmental: total number of carcasses due to environment (e.g. algae, low D.O)
- Poor Performers: total number of carcasses due to poor performers (includes precocious and maturing males and poor performers)
- Handling/Transport: total number of carcasses due to handling, transport or mechanical damage
- “Old”: total number of carcasses not of diagnostic quality (no reliable histological diagnosis)
- “Silvers”: total number of fresh carcasses that still have silver skin/scales and have died most recently, due to: no apparent reason, or they may show signs of disease. These carcasses are likely most reflective of the robust living “production population” and they generally represent less than 1% of the dead group.
- Matures: jacks – Pacific salmon species only

APPENDIX 7.2 Map of Fish Health Sub-zones in British Columbia

Not appearing on this map is the central coast **sub-zone 3.5** that spans the mainland coast from Deas Channel northward to Douglas Channel. In 2009, sub-zone 3.5 had three to five active fish farms operating at any given time in the Klemtu/Bella Bella region (see Table 7.3.1).

APPENDIX 7.3 Active Marine Salmon Farms**Table 7.3.1 Active Marine Salmon Farms 2009 (by calendar quarter)**

Atlantic Salmon	Quarter 1	Quarter 2	Quarter 3	Quarter 4	Average
Sub-zone 2.3 SW Vanc. Island	11	11	10	13	11
Sub-zone 2.4 NW Vanc. Island	6	10	10	11	9
Sub-zone 3.1 Sunshine Coast	2	2	2	1	2
Sub-zone 3.2 Campbell River	15	14	11	11	13
Sub-zone 3.3 Broughton	14	13	13	16	14
Sub-zone 3.4 Port Hardy	4	6	6	7	6
Sub-zone 3.5 Central Coast	5	4	3	4	4
Pacific Salmon					
Zone 2 Vancouver Island	3	4	3	4	3
Zone 3 East of Vanc. Island	5	6	5	3	5
Totals	65	70	63	70	67

APPENDIX 7.4 Bacteriology Findings

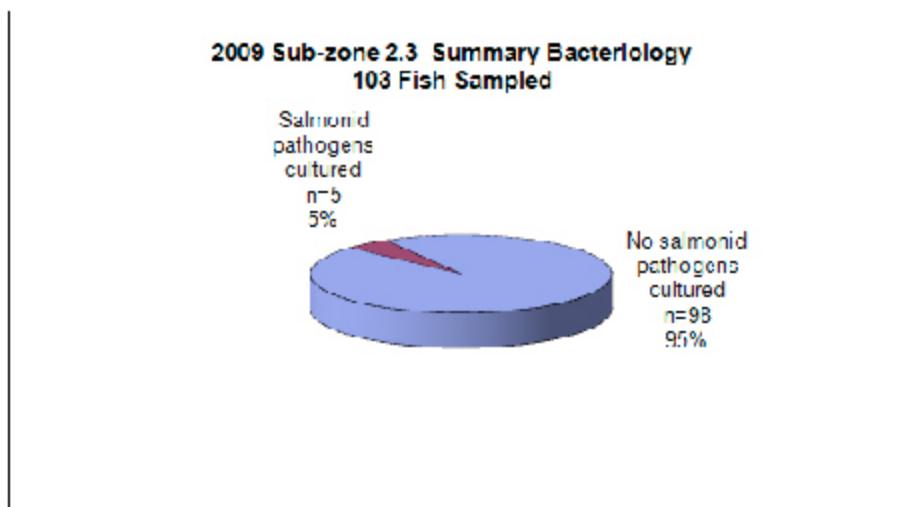

**Table 7.4.1: Bacterial Findings for Sub-zone 2.3 (SW Vancouver Island)
Atlantic Salmon Farm Audits 2009**

Quarter	# farms sampled*	# fish sampled	# of farms with bacteria cultured	Number of positive fish (per bacteria type) ^	Bacterial species cultured
Q1 Jan - Mar	5(4)	27	1	1	<i>Aliivibrio wodanis</i>
Q2 Apr - Jun	4	14	1	5	<i>Aeromonas salmonicida</i>
Q3 July - Sept	5	30	1	1	<i>Vibrio splendidus</i>
Q4 Oct - Dec	6	32	0	0	No bacteria cultured
Totals	20(19)	103	3	7	

* Occasionally there are no fish available or suitable for sampling on a farm. When a site audit is conducted but no samples are taken, the number of farms where samples were collected is indicated in brackets (e.g. 5(4) indicates that 5 farms were visited but fish samples were only available from 4 of those 5 farms).

^ Not all bacteria cultured are the cause of disease (i.e. pathogenic), many are opportunists. For a complete list of the bacteria cultured and their classification as either pathogen or opportunist, see Table 7.4.10 at the end of this appendix. In addition, a single carcass may be culture-positive for more than one type of bacteria.

Figure 7.5.9: Summary of Molecular Diagnostics Findings from Zone 3 Pacific Salmon Farm Audits 2009

APPENDIX 7.6 Audit Case Definitions

Bacterial Kidney Disease (BKD): A chronic granulomatous disease; the causative agent is *Renibacterium salmoninarum*. BKD is diagnosed in an Atlantic salmon population when the population is undergoing treatment for the disease, or if the fish sampled show gross clinical signs of the disease as well as population-level mortality.

BKD is often found in Pacific salmon populations to some degree. A Pacific salmon farm is diagnosed as positive for BKD if the farm is under treatment for the disease or if the fish sampled have gross clinical signs of BKD, histopathological lesions of BKD and the farm is experiencing population-level losses to the disease.

Furunculosis: A septicaemic disease caused by Gram negative *Aeromonas salmonicida*. Furunculosis is diagnosed in an Atlantic salmon population when the farm is undergoing treatment for the disease or when sampled carcasses exhibit septicaemia and population-level mortality.

Furunculosis disease rarely occurs in farmed Pacific salmon populations however the definition matches that of Atlantic salmon with the disease.

Infectious Haematopoietic Necrosis (IHNv): A viral _septicaemia* caused by a marine rhabdovirus. Atlantic salmon appear to have little or no natural immunity to IHNv. The infection and disease on a farm is diagnosed by means of a positive Polymerase Chain Reaction (PCR) test for the virus and confirmation by cell culture. High morbidity and mortality rates are often evident within 10 days of the initial infection. Farmed Chinook and Coho salmon are refractory to disease, but not the infection.

Loma salmonae: An endemic disease of Pacific salmon characterized by the presence of xenomas in the gill, pseudobranch and some internal organs. Loma is a microsporidian parasite found in fresh and saltwater populations of wild fish and in marine farmed Chinook salmon. Farmed Chinook may exhibit substantial weekly mortality rates over several months due to this parasite, particularly when water temperatures are between 12°C to 17°C.

Marine Anaemia (MA): An endemic disease of farmed Pacific salmon characterized by marked gill pallor, enlarged kidneys and spleens, ascites and exophthalmia. The cause of this disease may include a retroviral infection and/or an intranuclear microsporidian, *Nucleospora salmonis*. Marked haemoblast proliferation in specific organs is the histopathological hallmark of the disease. Grossly MA can appear similar and concurrent to BKD. A diagnosis of MA is considered in Pacific salmon populations if: the fish sampled have gross clinical signs of MA; histopathological lesions of MA; the farm is experiencing population-level losses, and severe BKD is not largely evident. Atlantic salmon do not appear to be afflicted by this form of marine anaemia.

Mouth Myxobacteriosis (mouth rot): A production disease of Atlantic salmon smolts during initial months of entry to sea water when the smolts are small; the disease tends to be problematic in spring-entered smolts, more so than in fall-entered smolts. The bacterium *Tenacibaculum maritimum* is consistently associated with the mouth lesions and is generally accepted as the etiologic agent. This diagnosis is assigned to an Atlantic smolt population when the group is being medicated for the disease, or if the fish sampled show gross clinical signs and histological evidence of the disease as well as population-level mortality (see VHS NAS for more information).

Net Pen Liver Disease (NPLD): Some farmed Atlantic smolts experience a debilitating liver condition thought to be associated with the natural algal toxin microcystin LR. The disease is environmental, not infectious, and is diagnosed as NPLD in Atlantic smolt populations when characterized by hepatic necrosis, hepatocellular megalocytosis and elevated mortality rates.

No Significant Findings / No Infectious Disease: Occasionally audits are scheduled that result in: a lack of fresh silver carcasses available for collection; or an interruption of travel or assessment due to weather; dive problems; or active natural harmful algae blooms. On these occasions, insufficient data is available to assign a diagnosis to the fish, nor is evidence of infection in numerous fish apparent.

Open diagnosis: The information collected and observations made during an audit are often inconsistent with the results of laboratory tests, or the test results of the samples submitted reflect a mixed etiology, or ‘no pathogen observed’. Often insufficient evidence exists to suggest population involvement of a specific disease (i.e. there is a low mortality rate and few silvers are available). In these cases, one must conclude that either the cause of death remains unknown or the mortality observed is incidental and not sufficient to assign a farm-wide disease diagnosis.

Parasitic Meningitis and/or Encephalitis: Microsporidian and Myxosporean parasites are indigenous to waters of BC and their appearance in the brains of some Atlantic salmon carcasses suggests this form of brain inflammation could be an incidental emerging disease, at least in selected groups of Atlantic salmon. The natural hosts of the parasites and the routes of transmission remain unknown for those parasites found sporadically in brains of Atlantic salmon. To date, the population-level mortality rate is low and the condition is deemed a laboratory finding, not an infectious disease (NID) or a production disease of salmon. There is no evidence that these parasites are moving beyond the brain vault of their Atlantic salmon host.

Post-vaccination Peritonitis (PVP): The presence of adhesions and peritonitis is observed grossly and histologically in farmed Atlantic and Pacific salmon that have received intra-peritoneal oil based vaccines. Severe PVP can decrease fish productivity and perhaps contribute to low-level mortality and downgrades at harvest due to adhesions and flesh melanisation.

Rickettsiosis: A chronic granulomatous and systemic disease caused by the intracellular pathogen *Piscirickettsia salmonis*. Rickettsiosis is diagnosed on an audit if the farm has: silvers with gross clinical signs of septicaemic disease, a positive PCR test for the pathogen, histopathological lesions by *Piscirickettsia* and population-level losses, or if an oral medication is underway to control the disease mortality.

Skin ulcers: A production disease of salmon typically during initial months of entry to sea water but it can also arise in larger or adult fish following physical handling or trauma, such as transport, grading, strong currents (abrasions from netting). The open skin lesions tend to develop during the cool-water winter months, sometimes called *“winter sores”*. The primary cause of the lesion is questionable but opportunistic and invasive bacteria of various types are always associated with the ulcers. This diagnosis is assigned to a fish population when the group is being medicated as a result of skin ulcers, or if the fish sampled show gross clinical signs and histological evidence of the disease as well as related population-level mortality at that farm (VHS NAS may again have an association with these ulcers).

Viral Haemorrhagic Septicaemia, North American Strain, genotype IVa (VHS NAS): A viral *“septicaemia”* caused by a rhabdovirus. VHS (NAS) is endemic in the Pacific herring populations and its presence in BC farms coincides with the herring migration. VHS is diagnosed on an audit if there is a positive PCR for VHS virus and/or positive culture on appropriate cell line, population-level losses (that may reach 2% per month) or histopathological lesions consistent with VHS viral infection. In recent years, VHS virus has been implicated as a confounding factor and/or an influence to mortality in other *“secondary infections”* like mouth myxobacteriosis.

APPENDIX 7.7 BCSFA Mortality Reports

BCSFA Mortality Reports: Quarter 1 (Jan - Mar)

Average Mortality Rate (Quarter 1 2009)					
Fish Health SubZone	Species	Life stages	# Fish Group	# Site	Rate
All Zones	Atlantic salmon	"Early"	17	11	5.11%
2-3	Atlantic salmon	"Later"	13	13	0.61%
2-4	Atlantic salmon	"Later"	11	11	0.36%
3-1 + 3-2	Atlantic salmon	"Later"	18	18	0.73%
3-3	Atlantic salmon	"Later"	24	19	1.19%
3-4 + 3-5	Atlantic salmon	"Later"	12	11	0.50%
All Zones ⁴	Atlantic salmon	"Later"	78	72	0.76%
All Zones	Pacific salmon	"Early"	96	15	1.49%
All Zones	Pacific salmon	"Later"	28	10	1.35%

Notes

1 Rate figures are aggregate weighted averages (agreed to with BC MAF – April 20, 2003)

2 Definitions for life stages:

"Early"	Eyed Egg →	Alvin / Larvae / Fry →	Pro-smolt (- parr)
"Later"	Smolt >	Grow-out / Harvest (- immature adult) Broodstock >	Spent/Post-Spawn (public facilities)

3 The following participants' data are in the system for this quarter

Creative Salmon
Grieg Seafoods
Heritage Salmon
Marine Harvest Canada/ Stolt Seafarms
Mainstream (Pacific National Aquaculture)
Panfish Canada (Omega Salmon Group)
Target Marine Products
West Coast Fish Culture

Companies/ participants not yet on the system

AquaMarine Industries
Omega Pacific
Saltstream Engineering
Totem Oysters
Yellow Island Aquaculture
Freshwater Fisheries Society of BC
(some data in the system)

Data in the system for this quarter but may be incomplete

Fisheries and Oceans Canada

4 This field has been added to encompass a small number of later life-stage Atlantic salmon (e.g., broodstock) raised in areas other than the subzones shown above.

1 Reporting reflects the stage other than water type. See notes 1 - 2 of Average Mortality Rate report.

2 Counts of veterinary diagnoses are based on FISH GROUP (not site); more than one fish group may exist at a site.

3 Fish Health Events reflect the following categories:

New First time occurrence; new event.

Ongoing/recurring Repeat or ongoing occurrence from previous calendar quarter.

Relapsing Repeat occurrence from calendar quarter at least two quarters preceding the current one.

4 "Case worked up but no diagnosis" category requires workup and management steps taken, e.g., further investigation, husbandry change etc.

This field has been added to encompass a small number of later life stage Atlantic Salmon (e.g., broodstock) raised in areas other than the subzones shown above.

APPENDIX 7.9 Sea Lice Life Stages Defined for Industry Monitoring and BCMAL Audits

Lepeophtheirus salmonis:

Adult female – includes all adult female lice, with egg strings (i.e. gravid female) or without egg strings.

Motile Lice or Mobile Lice – includes all ‘not permanently attached’ free-moving life stages: adult females (as above) plus adult male and pre-adult male/female lice.

Caligus – total numbers of motile *Caligus clemensi*, or other species if detectable grossly.

Chalimus - attached immature stages of both *Caligus* and *Lepeophtheirus*. Both types are categorised as chalimus since louse identification at those very early stages is not practical when cage-side.

Year class – age of fish in saltwater.

- “Year class 1” represents fish groups that share a similar date of salt water entry with the first fish on farm (i.e. within 6 months), plus the subsequent 12 months.
- “Year class 2” is defined as the remaining time in saltwater after that initial 12 months.
- Broodstock held in saltwater would be included in the Year class 2 group, up to March 1st of the year in which eggs will be collected. For broodstock relocated to freshwater facilities, information on health will be included in the freshwater section of the BCSFA industry database reports.

APPENDIX 7.10 Sea Lice BCMAL Audit Statistics

Table 7.10.1 Sub-zone 2.3 (BCMAL Audits 2009) Quarterly Mean and Median Abundance of Motile and Female *Lepeophtheirus salmonis*, Chalimus (*L. salmonis* & *Caligus clemensi*) and Motile *C. clemensi* on Atlantic Salmon (including tote counts).

^{NB.} Sea lice abundance on salmon raised within sub-zone 3.1 has been so low since monitoring began (2003) that the handling of these fish was deemed more harmful than useful. Consequently, this area was granted an exemption from routine sea lice counts until further notice, yet opportune counts are conducted by farm staff whenever possible. Audit counts by BCMAL continue (see Report Fig. 20a, 20b, and Table 7.10.3).

Notes:

() ~ total number of farms counts for months where two counts have been requested.

*** Reasons for missing farm lice counts**

- ~Site is fallow
- ~Site is harvesting and < 3 pens left on site
- ~Smolt entry and < 3 pens on site, or <1 month since third smolt pen entered
- ~Fish being treated for sea lice
- ~Fish being treated / managed for other fish health concerns
- ~Fish could not be handled due to environmental concerns, e.g. low DO

Figure 7.11.1 Monthly mean abundance of motile and female *Lepeophtheirus salmonis*, and motile *C. clemensi* on farmed Atlantic Salmon in sub-zone 2.3 as submitted to BCMAL by the BC Salmon Farmers Association (BCSFA) in 2009.

NB. Farm monitoring and audit procedures continue to identify a transient presence of *Caligus* lice species in a number of sub-zones. *Caligus* species are common on non-salmonid fishes; their presence on salmon in 2009 is attributable to wild herring and pilchard populations near salmon farms. *Caligus* lice are ubiquitous in the Pacific Ocean and recording their abundance on farmed fish can enable trend assessments over time.

Figure 7.11.2 Monthly mean abundance of motile and female *Lepeophtheirus salmonis*, and motile *C. clemensi* on farmed Atlantic Salmon in sub-zone 2.4 as submitted to BCMAL by the BC Salmon Farmers Association (BCSFA) in 2009.

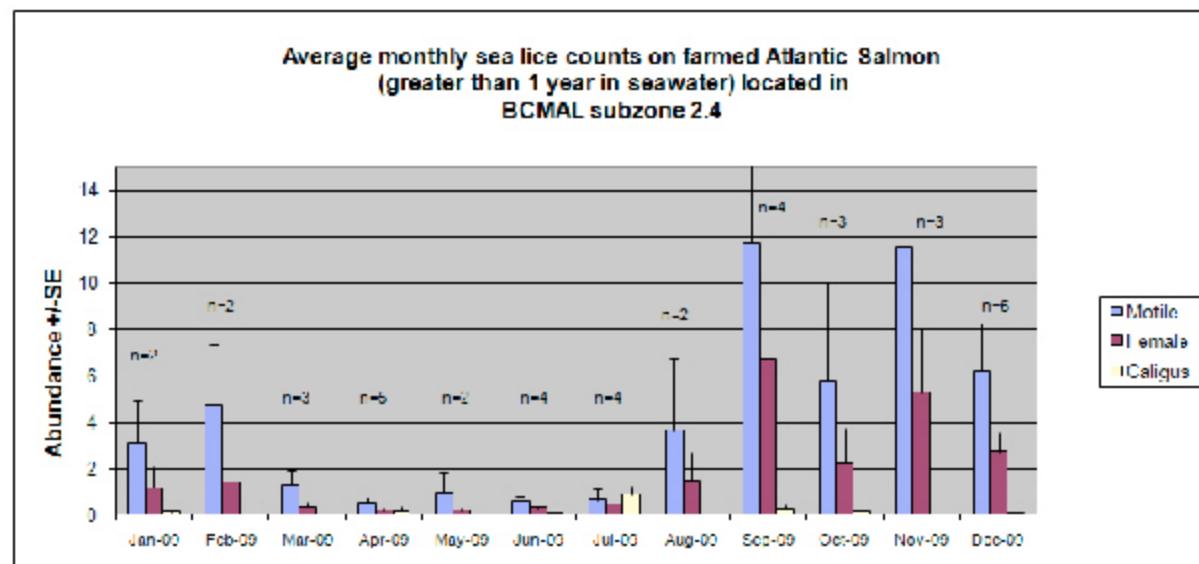

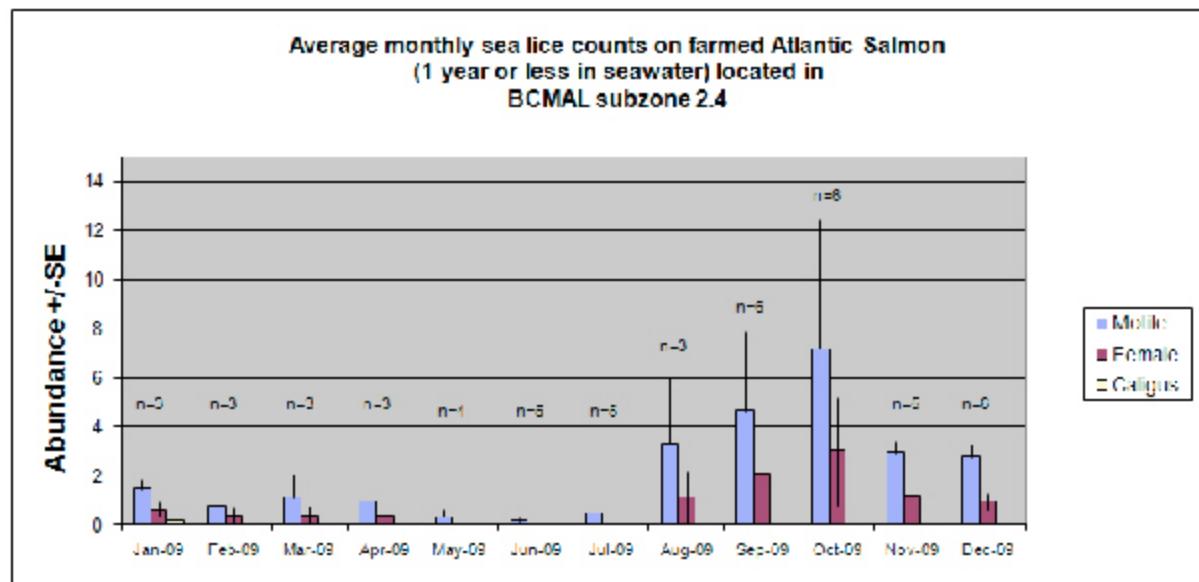

Figure 7.11.3 Monthly mean abundance of motile and female *Lepeophtheirus salmonis*, and motile *C. clemensi* on Farmed Atlantic Salmon in sub-zone 3.1¹ as submitted to BCMAL by the BC Salmon Farmers Association (BCSFA) in 2009.

*This page is
intentionally blank*

¹ Sea lice abundance on salmon raised within sub-zone 3.1 has been so low since monitoring began (2003) that the handling of these fish was deemed more harmful than useful. Consequently, this area was granted an exemption from routine sea lice counts until further notice, yet opportune counts are conducted by farm staff whenever possible. Audit counts by BCMAL continue (see Report Fig. 20a, 20b, and Table 7.10.3).

Figure 7.11.4 Monthly mean abundance of motile and female *Lepeophtheirus salmonis*, and motile *C. clemensi* on Farmed Atlantic Salmon in sub-zone 3.2 as submitted to BCMAL by the BC Salmon Farmers Association (BCSFA) in 2009.

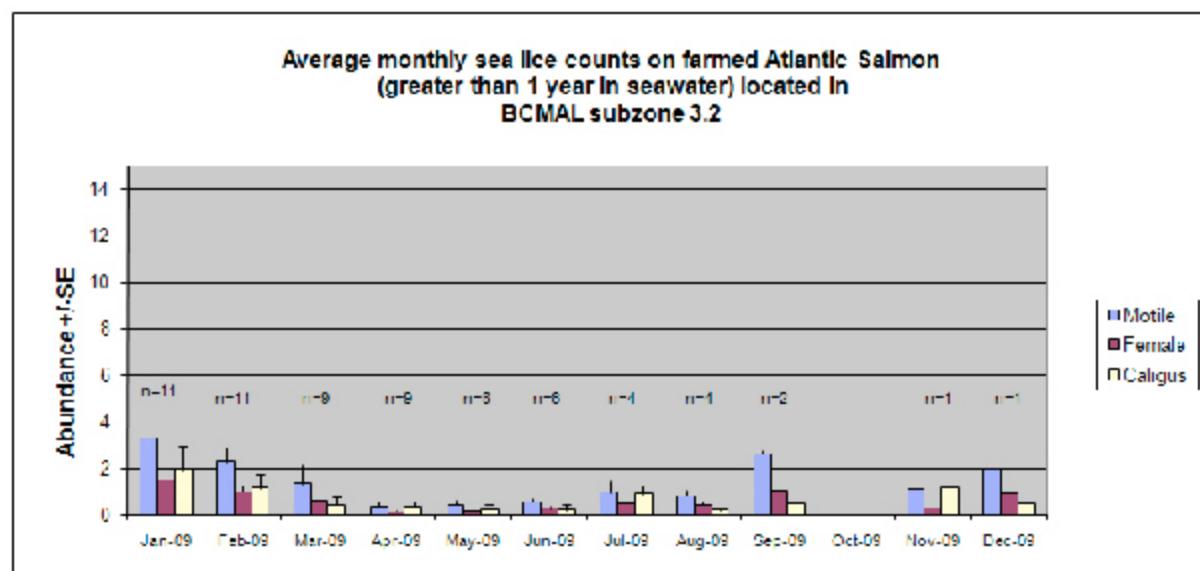

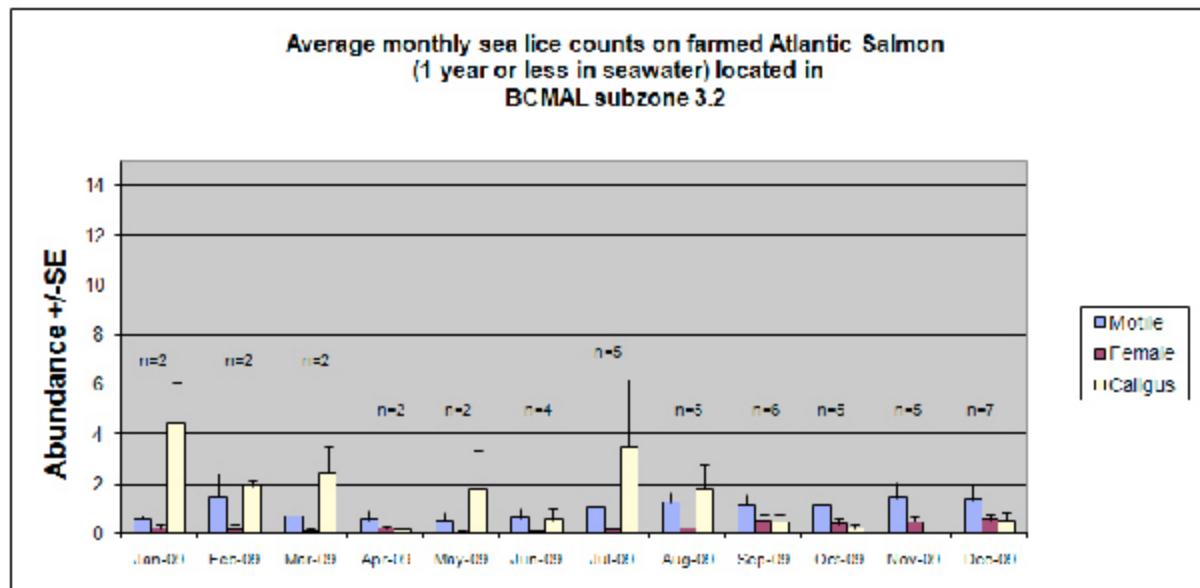

Figure 7.11.5 Monthly mean abundance of motile and female *Lepeophtheirus salmonis*, and motile *C. clemensi* on Farmed Atlantic Salmon in sub-zone 3.3 as submitted to BCMAL by the BC Salmon Farmers Association (BCSFA) in 2009.

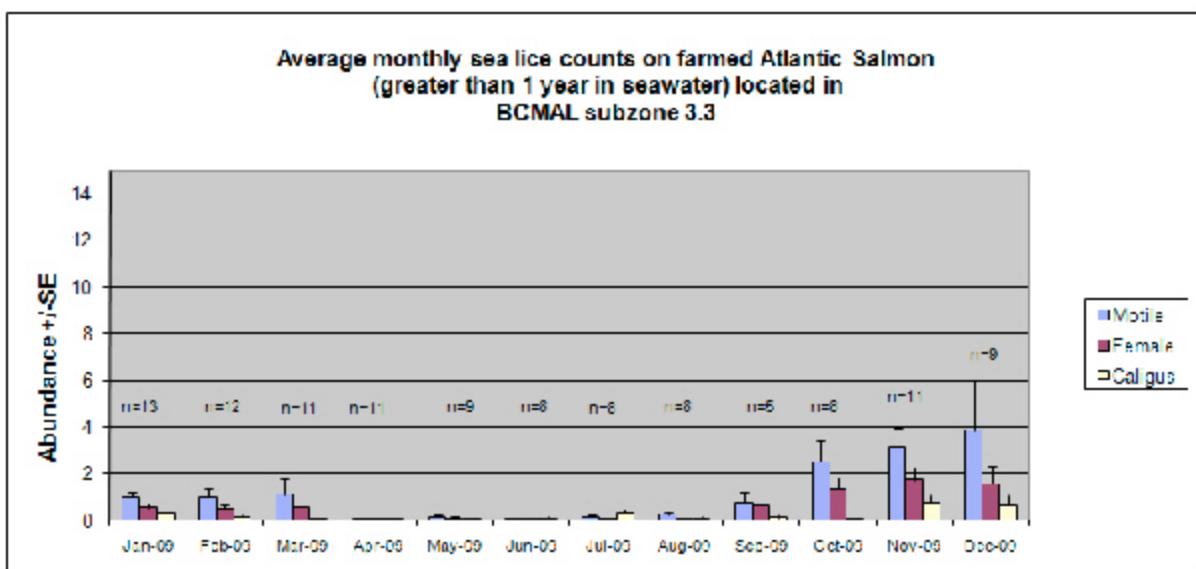

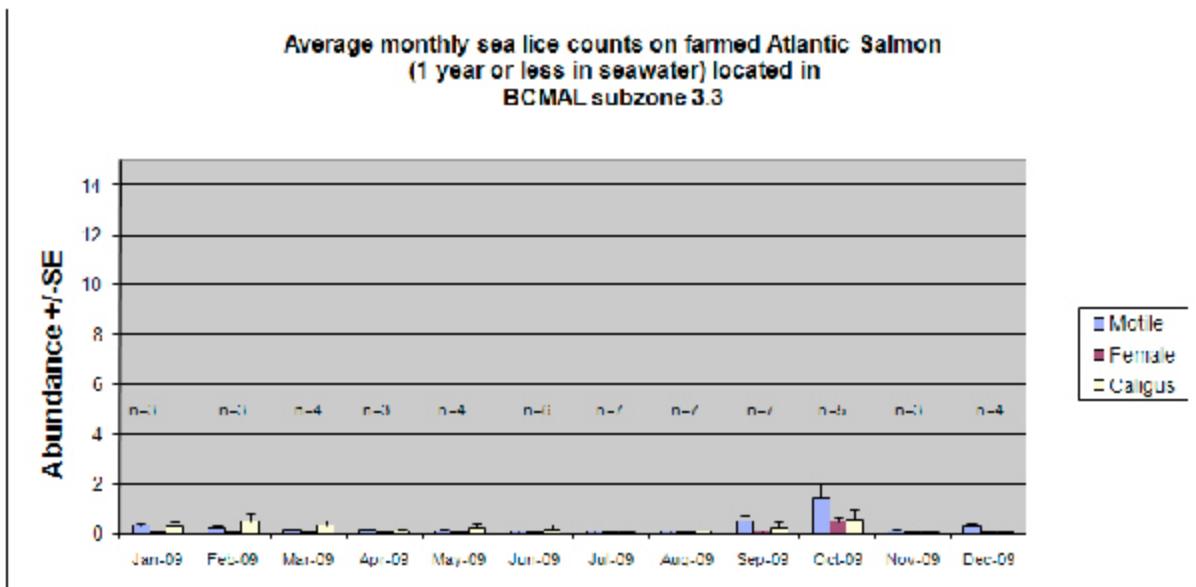

Figure 7.11.6 Monthly mean abundance of motile and female *Lepeophtheirus salmonis*, and motile *C. clemensi* on Farmed Atlantic Salmon in sub-zone 3.4² as submitted to BCMAL by the BC Salmon Farmers Association (BCSFA) in 2009.

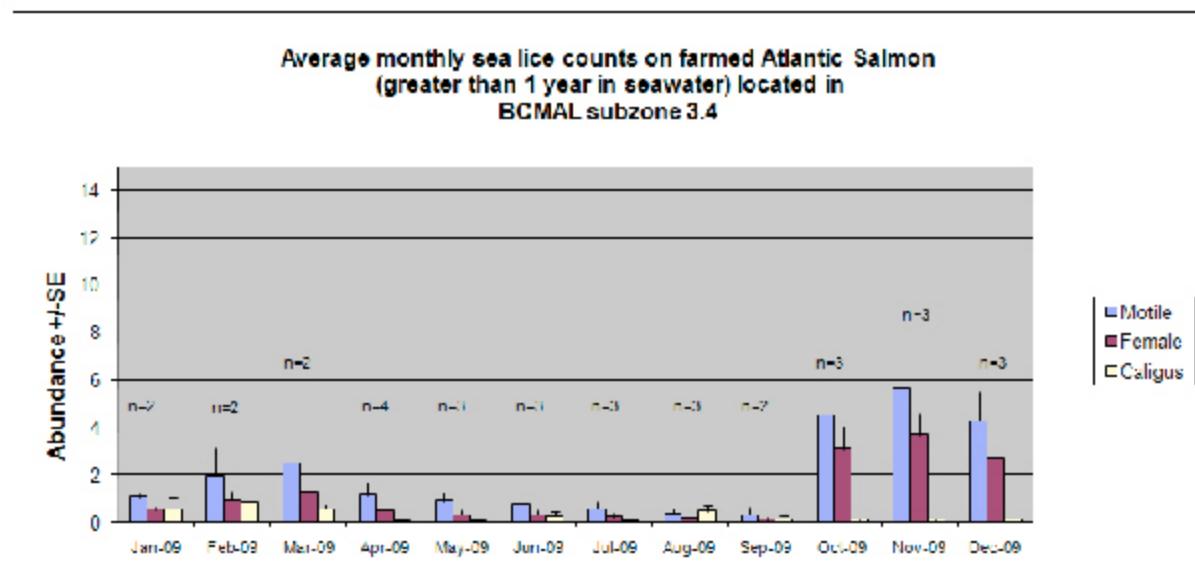

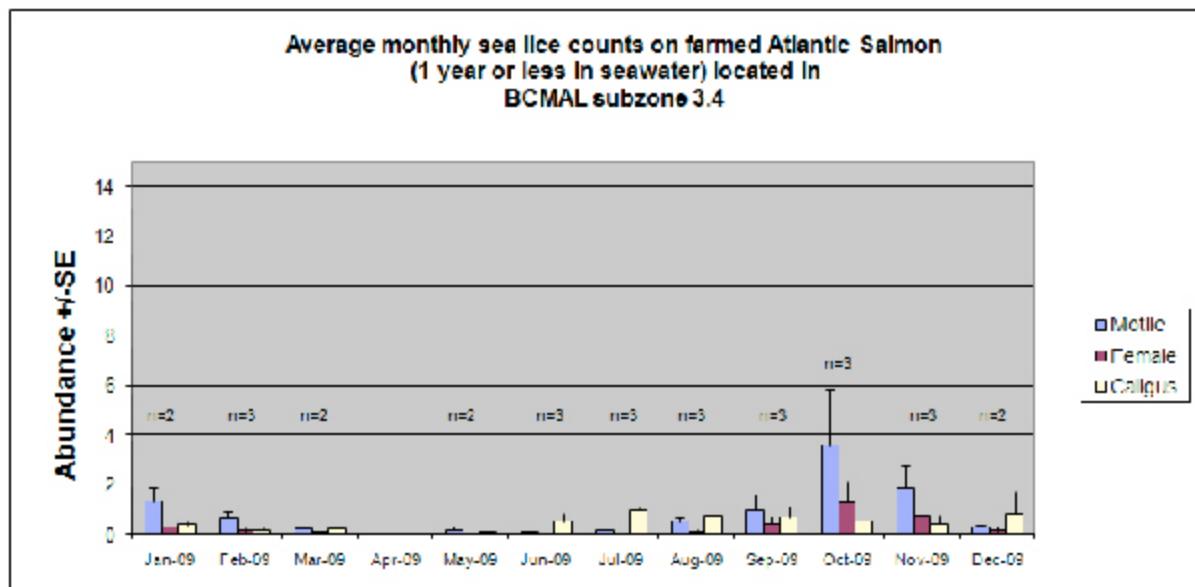

Figure 7.11.7 Monthly mean abundance of motile and female *Lepeophtheirus salmonis*, and motile *C. clemensi* on Farmed Atlantic Salmon in sub-zone 3.5 as submitted to BCMAL by the BC Salmon Farmers Association (BCSFA) in 2009.
