**Follow Up Flag:** Follow up  
**Flag Status:** Red

Hello Simon,

Today I shipped three 75 cm<sup>2</sup> flasks with ASK-2 cell monolayers.  
The cells are 2 days old today.

To use, we split them 1:2 when the monolayer is confluent. Growth medium is L-15 + 1 mM L-glutamine + 10% FBS (from Sigma .. Hybridoma tested) + 1x antibiotics. Maintenance medium is same with FBS reduced to 5%.

These cells grow very slowly but once confluent they are very susceptible to ISAV (I have seen CPE come up in 2 days!). However, I do not know how good they are for primary virus isolation.

I have also include ISAV isolate NBISA01 RNA in formamide.

To use, precipitate with 2.5 x volume 100% ethanol in high salt and then resuspend in RNase-free water.

The shipment was sent Federal Express. The FedEx track number is as follows:  
4967 8015 7201.

Let me know when you receive it.

Regards,

Fred.

**Jones, Simon**

Hello Simon,

Good to hear from you. I would be happy to run those samples through our RT-PCR system here. We also use the segment 8 F5/R5 primers. We clone our products using the Invitrogen TOPO TA Cloning kit and use a commercial company for sequencing.

Feel free to send the samples along and I will let you know what we find.

Best regards.

Fred.

(by the way, I plan to be in Nanaimo for the Thanksgiving weekend.  
Hopefully I will see you then?).

Hello Simon,

I just wanted to let you know that I received the 20 samples (1A-10A and 1B-10B) in good condition, and will soon start working on them.

All the best.

Fred.

Hello Simon,

Attached are some gels of the testing on the 20 samples.  
My pictures are clearer than this (clear enough to cut the bands out) but I thought you might want to have an idea of the intensity of the bands compared to the positive controls?

All the best.

Fred.

Hello Simon,

Attached is the information I have obtained on the segment 7 clones. You will note that I am being very cautious.

All the best.

Fred.

High Sea Chinnok Salmon samples labeled 1A to 10A and 1B to 10B, checked for ISAV using RT-PCR (samples received from DFO, PBS, Dr. Simon Jones/Dr. Molly Kibenge).

| Sample ID           | Segment 8 primers (F5/R5) | Segment 7 ORF1 primers |
|---------------------|---------------------------|------------------------|
| 1A                  | + ve (~220bp)             | - ve                   |
| 2A                  | + ve (~220bp)             | + ve (~400bp)          |
| 3A                  | weak + ve (~220bp)        | not done               |
| 4A                  | - ve                      | not done               |
| 5A                  | - ve                      | not done               |
| 6A                  | - ve                      | not done               |
| 7A                  | - ve                      | not done               |
| 8A                  | - ve                      | not done               |
| 9A                  | - ve                      | not done               |
| 10A                 | - ve                      | not done               |
| 1B                  | - ve                      | not done               |
| 2B                  | - ve                      | not done               |
| 3B                  | + ve (~220bp)             | - ve                   |
| 4B                  | + ve (~220bp)             | + ve (~400bp)          |
| 5B                  | - ve                      | - ve                   |
| 6B                  | - ve                      | + ve (~400bp)          |
| 7B                  | - ve                      | not done               |
| 8B                  | - ve                      | not done               |
| 9B                  | - ve                      | not done               |
| 10B                 | + ve (~220bp)             | + ve (~400bp)          |
| NBISA01 +ve control | + ve (~220bp)             | + ve (903bp)           |

- ve denotes no PCR product seen; + ve denotes PCR product (size in base pairs) seen.

## Sequence Analysis of the RT-PCR products of the Segment 7 ORF1 primers:

All 5 RT-PCR products obtained were subcloned using the TOPO TA cloning kit. The DNA inserts were then sequenced.

The NBISA01 +ve control DNA insert was 903 bp long.

All inserts of the DFO samples were 377 bp long.

The DFO samples were 99.7% identical and corresponded to the ISAV Segment 7 ORF2 product. They had a 95.8% identity with the NBISA01 +ve control, and 99.7% identity with ISAV strain 810/9/99 from Norway. The sequences are given on page 3, and sequence comparisons using the FASTA program are attached in the next 6 pages (pages 4-9).

[These particular DFO samples were processed separately by myself together with ISAV isolate NBISA01 as positive control. So, I can rule out cross contamination during RNA extraction. However, I also have a graduate student working with both New Brunswick and European (Norway, Scotland, Nova Scotia) ISAV isolates, and cannot conclusively rule out the possibility (however small!) of reagent contamination. Reagent contamination is unlikely since the RT-PCR product was not in all samples tested. For this reason, I am sending you the sequence of the Segment 7 ORF1 primers that I used so that you can try them on your samples. Also, I wish to encourage you to send other blind samples to me for RT-PCR testing so that you can confidently interpret your results].

### Segment 7 ORF1 primers:

For the purpose of evaluating individual ORFs, we separated the otherwise partial overlapping ORFs of segment 7 based on the gene expression model suggested by Ritchie *et al.* (2002), of partial splicing of ORF1 mRNA and a frameshift such that ORFs 1 and 2 products share the first 22 amino acid residues.

Hello Simon,

\* Attached is the information I have obtained on the segment 8 clones. I suppose this result rules out the possibility of "reagent contamination" with lab. virus strains!

All the best.

Fred.

High Sea Chinnok Salmon samples labeled 1A to 10A and 1B to 10B, checked for ISAV using RT-PCR (samples received from DFO, PBS, Dr. Simon Jones/Dr. Molly Kibenge).

| Sample ID           | Segment 8 primers (F5/R5) | Segment 7 ORF1 primers |
|---------------------|---------------------------|------------------------|
| 1A                  | + ve (~220bp)             | - ve                   |
| 2A                  | + ve (~220bp)             | + ve (~400bp)          |
| 3A                  | weak + ve (~220bp)        | not done               |

| 4B                  | + ve (~220bp)             | + ve (~400bp)          |
| 5B                  | - ve                      | - ve                   |
| 6B                  | - ve                      | + ve (~400bp)          |
| 7B                  | - ve                      | not done               |
| 8B                  | - ve                      | not done               |
| 9B                  | - ve                      | not done               |
| 10B                 | + ve (~220bp)             | + ve (~400bp)          |
| NBISA01 +ve control | + ve (~220bp)             | + ve (903bp)           |

- ve denotes no PCR product seen; + ve denotes PCR product (size in base pairs) seen.

## **Sequence Analysis of the RT-PCR products of the Segment 8 F5/R5 primers:**

Attempts were made to clone some of the RT-PCR products obtained using the TOPO TA cloning kit. The DNA inserts were then sequenced.

The NBISA01 +ve control DNA insert was 211 bp long.

Inserts of the DFO samples were variable in size and ranged from 116 bp long in clone 3B to 211 bp long in clone 2A. Of these clones, the most representative (based on sequence analysis) was clone 10B with a DNA insert of 187bp (since as shown in the alignment on page 13, clone 10B lines up very well with clone 2A; both 3B and 4B are missing internal sequences between the F5 and R5 primers because of an internal mis-priming or duplicate sequence; in clone 4B the F5 primer sequence is also duplicated, in tandem).

The DNA insert in clone 2A was the most similar to the NBISA01 +ve control DNA insert with 94.3% sequence identity. The other DFO samples sequenced (3B, 4B, and 10B) were only similar to the NBISA01 +ve control DNA insert in the primer regions, whereas they had considerable areas of sequence identity among themselves: 100% identity in 72 nucleotide overlap between 3B and 4B; 97.9% identity in 97 nucleotide overlap between 3B and 10B; and 95.9% identity in 97 nucleotide overlap between 4B and 10B. Thus the "DFO B samples" would seem to contain a unique sequence, represented as clone 10B with a DNA insert of 187bp, amplified using the ISAV segment 8 F5/R5 primers. The smaller RT-PCR product of DFO 10B compared to ISAV NBISA01 is due to internal deletions in DFO 10B. I suppose this result rules out the possibility of "reagent contamination" with laboratory virus strains! For specific amplification of the virus in your samples, I suggest that you design new primers based on the DFO 10B clone sequence but excluding the F5 and R5 sequences. It would be interesting to see if these new primers amplify the original ISAV.

The sequences are given on page 11, the sequence alignment of the 4 sample is shown on page 12, and the sequence comparisons using the FASTA program are given on pages 13-15.

This completes the analysis of the 20 High Sea Chinnok salmon samples. I look forward to more blind samples from you.

All the best.

Fred.

Hi Molly,

Here is the ACGT information you wanted:

They sequence PCR products.

Sequencing can be done with PCR primers used to generate the PCR product, but you would miss the primer sequence (i.e., the M13 Forward primer sequence or the M13 Reverse primer sequence would not show). If you want complete sequence then you have to ask to sequence with both primers separately.

In 10% of the sequencing reactions (that do not work) they may want to try internal primers, i.e., your F5 or R5 primers; but they would let you know if this is necessary.

To sequence a 500bp product, they need 50 ng per reaction. It is recommended that you pass your PCR product through the QIAGEN PCR purification kit, and then send them the purified material as is. They prefer that you also send them a photo of the gel (together with the sample for sequencing) indicating the volume of the PCR product that was loaded.

They charge \$30 per sequencing reaction. For a 500bp fragment, you need only one reaction.

Here is the contact information:  
Ask for Chi or Philip.

ACGT Corporation  
100 Bay Street, 11th Floor  
Toronto, Ontario  
M5G 1Z6

Tel: 1-800-735-0847 or  
1-416-977-2228.

Fax: 1-416-977-7122.

You already have their e-mail address: order@acgtcorp.com.

Let me know if you need more information.

Fred.
