**V. RESEARCH AND PROFESSIONALLY RELATED SCHOLARLY AND CREATIVE ACTIVITIES**

**a) Areas of special interest and accomplishments in discipline:**

I have been heavily involved in the development of rapid techniques for teaching systems analysis and mathematical modelling to biologists and resource managers, using problem-oriented workshops and seminars. I have conducted over two dozen three to ten day workshops in the past ten years, first for the International Canadian Fisheries Service, US Fish and Wildlife Service, and the International Institute for Applied Systems Analysis.

My main research work now is on the theory of harvesting in natural resource management. I have published on applications of stochastic optimal control theory to the analysis of populations in variable environments, and my chief interest is in the basic problem of how to behave adaptively in the face of extreme uncertainty.

I also maintain an active field research program on the responses of aquatic communities to disturbances such as removal of selective species by introduced fish populations and enhancement of productivity through fertilization.
